

PART 1: DOWNLOAD THE CHOSEN SPECIES FROM NCBI AND UPLOAD IT IN GALAXY FOR GENOME EXPLORATION

SPECIES: *Hipposideros armiger* (Great Roundleaf Bat) genome assembly (GCF_001890085.2 / ASM189008v1)

GALAXY FILE NAME: 1: *Hipposideros_armiger_genome_original.fna.gz*

NOTE: This is only a screenshot as I cannot upload the raw file on GitHub due to its large file size. Therefore, this screenshot will serve as evidence that I indeed downloaded the raw genome.

The screenshot displays the Galaxy web interface. At the top, a yellow folder icon represents the uploaded dataset. Below it, the file name **GCF_001890085.2_ASM189008v2_genomic.fna** is shown, along with a 'Share' button. A 'Details' section provides metadata: **Type** is 'Compressed Archive Folder', **Size** is '521 MB', **File location** is 'C:\User\winah marie\Downloads', and **Date modified** is '12/06/2026 8:37 am'. A 'Properties' button is also visible.

The main workspace shows the dataset **1: Hipposideros_armiger_genome_original.fna.gz** with a green 'ok' status. It indicates 7,387 sequences in **fasta.gz** format, with a size of 637.6 MB. A warning banner states: 'This dataset is large and only the first 100 KB is shown below.' Below the warning, a preview of the FASTA sequence is visible, starting with `>NW_017731350.1 Hipposideros armiger isolate ML-2016 unplaced genomic scaffold, ASM189008v1 scaffold_0, whole genome shotgun sequence`.

The left sidebar contains navigation options: 'Activities', 'Tools' (with a search bar), 'Workflows', 'Workflow Invocations', 'Interactive Tools', 'Notifications', and 'More'. The 'Tools' section is expanded, showing categories like 'General Text Tools' and 'Genomic File Manipulation'. The 'History' panel on the right shows a list of datasets, including 'Genome_Exploration_II_Suan_Hipposideros_ar...' and '1: Hipposideros_armiger_genome_original.fna.gz'.
