

PART 4- SIMPLE LENGTH-FILTERING EXPERIMENT (RESULTS)

Tool used: **gfastats** (re-run on filtered genome)

Input file: **Hipposideros_armiger_filtered_10kb**

Minimum length filter applied: **10,000 bp**

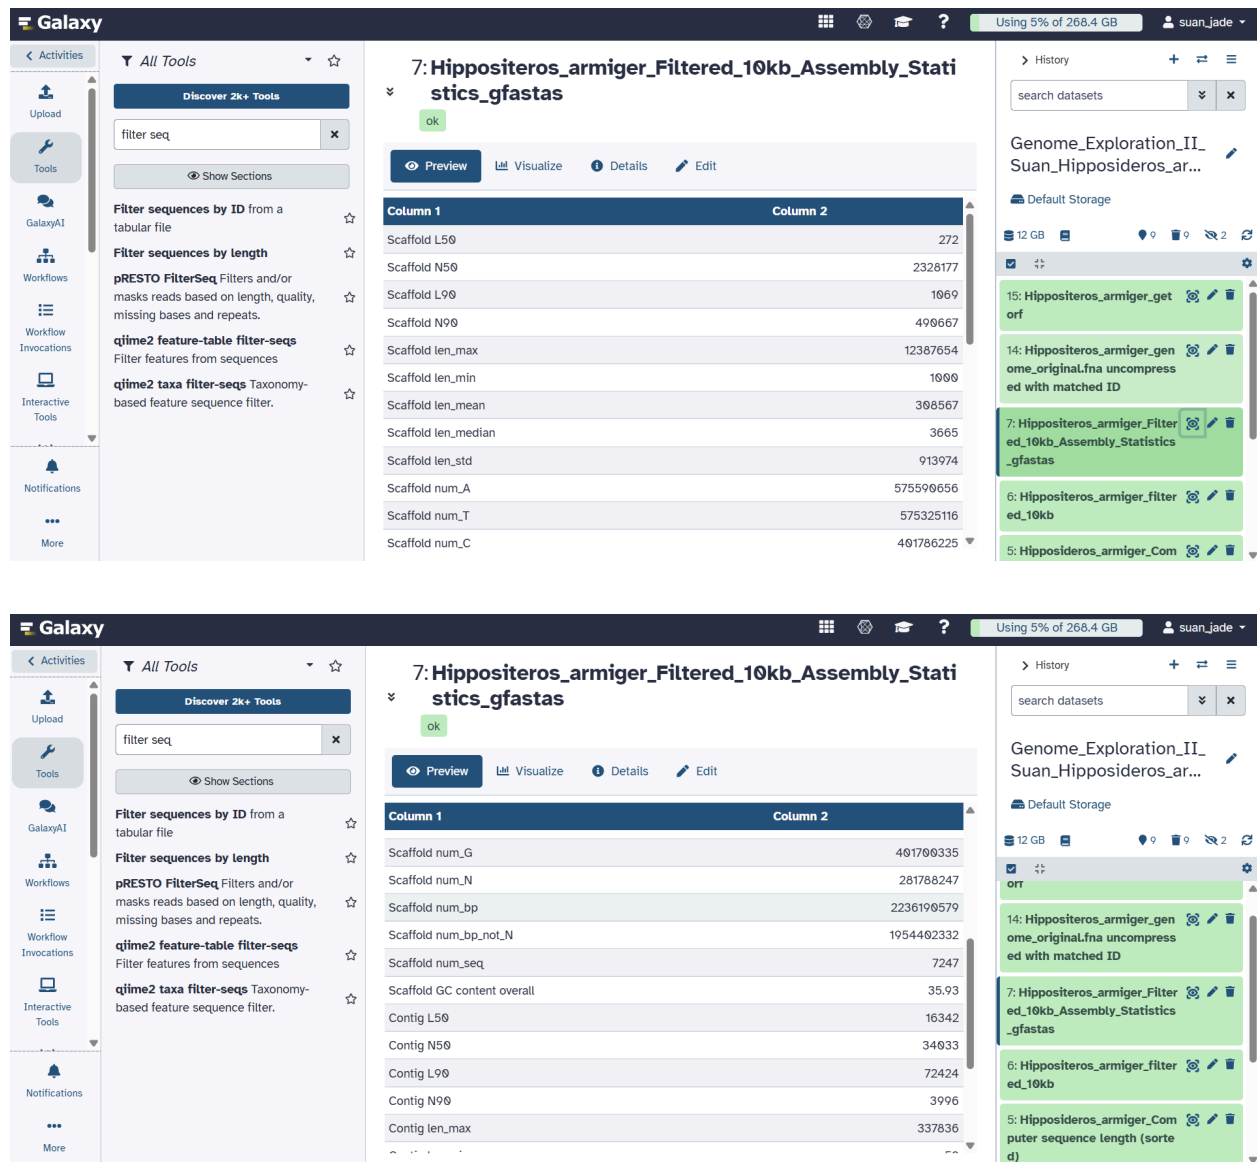

Figure 4b. Assembly statistics output from gfastats after filtering sequences $\geq 10,000$ bp. Comparison with the original genome shows that removing short sequences had almost no effect on total length, N50, and GC content, indicating short scaffolds contribute minimally to the overall assembly.
